Milestone 3 Part 1 Review Summary GSD Team Project 2026 Team 2

Team Number

Team 2

Project Name

SkillBridge

Date

02.06.2026

1. Summary of Feedback and Tasks to Do

During the Milestone 3 Part 1 review, the team presented the current status of the SkillBridge application, including the deployed software, user interface prototype, main workflows, GitHub structure, database status, and implemented Priority 1 functionality.

The review focused mainly on the core product functionality that will be delivered for the final version of the project. The team demonstrated the current horizontal/UI prototype and discussed the main workflows for guest users, students, tutors, and administrators. The most important workflows reviewed were registration, role-based access, tutor profile creation, tutor search, tutor approval, messaging, reporting, and admin management.

The professor reviewed the planned and partially implemented functionality and gave feedback on the communication flow between administrators and tutors. One important feedback point was that administrators should be able to send messages directly to approved tutors. This is useful because admins may need to contact tutors about profile approval, missing profile information, moderation issues, uploaded content, or other administrative topics. Another important feedback point was that tutors should also be able to send messages to admins. This allows tutors to ask questions about approval status, rejected profile information, reported content, or account-related problems.

Based on this feedback, the team decided to include admin–tutor messaging as part of the final P1 communication functionality. The messaging feature should not only support student–tutor communication but also allow communication between admins and approved tutors. This improves the moderation and approval workflow and makes the platform easier to manage.

The professor also emphasized that the final product should focus only on Priority 1 functionality after Milestone 3. Therefore, the team agreed to enter the feature-freeze

phase and focus on completing, testing, and polishing the core features instead of adding new optional features. Priority 2 and Priority 3 features will only be implemented if the P1 features are stable and complete.

2. Tasks After the Milestone 3 Review

After the Milestone 3 review, our team decided to focus mainly on completing and improving the P1 features for the final delivery. The most important task is to make sure the deployed application works properly, especially the home page, search page, and search results connected to the backend.

We also need to finish the tutor search functionality, including input validation. The search field should only accept valid alphanumeric input and follow the required character limit. Role-based registration and login for students, tutors, and admins also need to be completed and tested.

Another important task is the tutor profile workflow. Tutors should be able to create and edit their profiles, and admins should be able to approve or reject them. Only approved tutors should appear in the search results.

Based on the professor's feedback, we will also add messaging between admins and approved tutors. Admins should be able to send messages to approved tutors, and tutors should be able to send messages to admins. Student-to-tutor messaging will also be completed if it is not fully finished yet.

For the admin side, we will complete the dashboard functions for tutor approvals and reported content. Students should be able to report tutor profiles, messages, or uploaded content, and admins should be able to review and resolve these reports.

We will also focus on security and quality. Passwords must be securely hashed, restricted pages must be protected based on user roles, and the frontend and backend code should follow the agreed coding style. Before the final review, we will prepare realistic database test data, improve UI responsiveness, test the deployed version, and clean up the GitHub repository.

Overall, the Milestone 3 review helped us clarify the final product scope. The team agreed to focus only on P1 features and include admin–tutor messaging as an important part of the final communication workflow.

---

3. Tasks for Final Delivery

For the final delivery, our team will focus on the following areas:

Authentication and User Management

We will complete Fulda-only registration using hs-fulda.de email addresses. Users should be able to log in and access the system based on their role, such as student, tutor, admin, or super admin. Passwords will be stored securely using hashing, and restricted pages and backend endpoints will be protected.

Tutor Profile and Approval

Tutors will be able to create and update their profiles. They can add information such as subjects, skill badges, bio, teaching style, languages, and availability. New tutor profiles will be marked as pending until an admin approves them. Only approved tutor profiles will be shown in public and student search results.

Search and Search Results

The tutor search will allow users to search by subject or keyword. The home page search and search results will be connected to the backend. Search results will only show approved and visible tutors. We will also make sure the search input is validated and the results page is clear and responsive.

Messaging

The messaging system will support communication between students and tutors. Based on the professor's feedback, we will also include messaging between admins and approved tutors. Tutors should also be able to message admins. Messages will be stored in the database and shown with conversation history and timestamps.

Reporting and Moderation

Students will be able to report suspicious, offensive, misleading, or spam content. Reports can be related to tutor profiles, messages, or uploaded content. Admins will be able to view reports, take action, and mark reports as resolved.

Admin Dashboard

The admin dashboard will show pending tutor approvals, reported content, and basic platform information where possible. Admins will be able to approve or reject tutors, review reports, and take moderation actions such as hiding, suspending, or deleting inappropriate content.

Media Upload Validation

Uploaded files will be checked for valid file type and maximum file size. Invalid files will be rejected, and useful error messages will be shown to the user.

UI and Responsiveness

We will complete the main P1 UI pages, including home, search, results, profile, messaging, and dashboard pages. The layout should work properly on desktop, tablet, and mobile screens.

Deployment and Code Quality

The application will stay deployed on the final server. We will check the frontend, backend, database, and reverse proxy integration. The GitHub repository will be cleaned up, commit messages should be meaningful, and the code should follow the agreed coding style.

---

4. Final P1 Functions

The final SkillBridge product will focus on the following P1 functions.

Guest Users

Guest users can access the public landing page, search approved tutor profiles, and view limited tutor preview information. They cannot message tutors or use protected features without logging in. Public pages should be responsive on desktop and mobile devices.

Students

Students can register using a Hochschule Fulda email address and log in after verification. They can search tutors, view approved tutor profiles, open tutor details, send messages to tutors, and report profiles, messages, or uploaded content. Students can also access a responsive student dashboard and view a demo payment flow, which will clearly be marked as not real payment processing.

Tutors

Tutors can register with a Hochschule Fulda email address and access tutor-specific functions. They can create and edit tutor profiles, add subjects, skill badges, languages, bio, teaching style, and availability. Their profiles must be approved by an admin before becoming public. Tutors can receive and reply to student messages, send messages to admins, upload valid media files, and use a responsive tutor dashboard.

Admins and Super Admins

Admins can log in and access the admin dashboard. They can view pending tutor profiles, approve or reject tutors, view reported content, and take moderation actions. Admins can also send messages to approved tutors, review flagged uploads, and deactivate or delete inappropriate accounts or content.

Technical and Security Functions

The application will be deployed on the final platform with frontend, backend, and database integration. Search will be connected to the backend and include input validation. Passwords will be securely hashed, protected routes will be restricted by user role, and the codebase will follow the agreed coding style. The system will be tested before final delivery.

---

5. Feature Freeze Decision

After Milestone 3, the team agreed to focus only on the final P1 features. Priority 2 and Priority 3 features, such as advanced filtering, ratings, availability calendar, recommendations, tutor comparison, and analytics, will only be considered if all P1 features are completed and stable.

The main goal for the final delivery is to provide a stable working version of SkillBridge with registration, role-based access, tutor profile creation, admin approval, tutor search, messaging, reporting, moderation, and responsive user interfaces.
